

# Analysis of North Carolina Voter Turnout in the November 2016 General Election

## EXECUTIVE SUMMARY

As part of the Local Election Project sponsored by the Reese News Lab, publicly available data created by the North Carolina Board of Elections was used to analyze voter turnout for the November 2016 general election. Three different analyses were done

1. Turnout for 2016 was analyzed by political affiliation (Democrat, Republican, Libertarian, and Unaffiliated) of voters for each election precinct in North Carolina
2. Using a model that predicts the “political sentiment” of Unaffiliated and Libertarian voters (either Republican sentiment or Democratic sentiment), turnout for 2016 was analyzed by this sentiment for each election precinct in North Carolina.
3. Turnout for 2016 was compared with turnout from the 2012 and 2008 general elections and the relative change was analyzed by political affiliation for each elections precinct in North Carolina.

Data from these three analyses is presented in Appendices A, B, and C respectively at the end of this report. Each appendix sorts the data in either two or three different ways highlighting the election precincts at extremes in either voter turnout or change in voter turnout.

## METHODOLOGY

### DATA ACQUISITION

Analyzing turnout requires that for each election under analysis, we link the voter registration file **for a particular election** with a flag that indicates whether each voter in the registration file voted in the specific election. So, we started with three specific voter registration files provided by the state of North Carolina, one for November 2008, one for November 2012 and one for November 2016. Since there were over 7 million records in each file, each of the three was loaded into a local Microsoft SQL database for easy access via SQL query. A sample of this data (for 2008) is shown in Figure 1 below.

# Analysis of North Carolina Voter Turnout in the November 2016 General Election

Figure 1

Voter participation since 2007 is captured in a single voter history file also provided by the state of North Carolina containing a single record for each vote cast in any election since 2007. This file contained over 30 million records, so it too was loaded into a Microsoft SQL database. A sample of this data is shown in Figure 2 below.

	ncid	election_lbl	county_desc
0	AA10737	11/02/2010	ALAMANCE

14	AA107373	11/04/2014	ALAMANCE

Figure 2

North Carolina uses a unique descriptor for each voter that is or has been registered to vote in the state during the years of analysis called 'NCID'. We verified that this descriptor is in fact unique. NCID is available in both the voter registration data for the three years in question and the voter history file, so we decided to use this as our key to link the registration with the history data.

We worked with and analyzed all data using Python, specifically the PANDAS package.

## DATA SHAPING AND JOINING

In order to connect the voter registration with voter history data, it was necessary to 'flatten' the voter history data so that instead of several rows for each voter (represented by NCID), we had a single row for each voter containing information on their participation in all general elections. We used PANDAS pivot table technology to reshape voter history accordingly. A sample of this flattened data is in Figure 3 below:

2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2018	ncid
0	1	0	0	0	0	0	0	0	1	0	AA100000
0	1	0	1	0	1	0	1	0	1	0	AA100006
0	1	0	1	1	1	0	1	0	1	0	AA100007
0	1	0	0	0	1	0	0	0	0	0	AA100008
0	1	0	1	0	1	0	1	0	1	0	AA100009

Figure 3

Note that the flattened data has a single row for each unique NCID and columns containing a '1' if the voter with that NCID voted in the general election in that year and an '0' (or 'NaN' which is equivalent to 0) if that voter did not vote in that election. Also note the column for 2018 which highlights that fact that the voter history data has errors in it. In general, we tried to clean all data as necessary to do our analyses, but since we're only looking at 2008, 2012, and 2016 the 2018 column was not used.

# Analysis of North Carolina Voter Turnout in the November 2016 General Election

We now needed to join the three data tables with registration and demographic data (2008, 2012, and 2016) with the data table containing the flattened voter history. The reason we needed to use the three demographics snapshots (rather than a single snapshot) is because we will measure voter turnout as the quotient of the number of registered voters that voted in each of the three elections in question divided by the total number of voters **registered for each of the three specific elections**.

For each of the three years, we do a 'left join' of the registration/demographic data with the flattened voter history data using NCID as the key field. This provides us with a single table of voters registered in each of these years containing both demographic and voting history data. A sample of this table is in Figure 4 below for each year in question:

county_desc	party_cd	precinct_abbrev	2008	county_desc	party_cd	precinct_abbrev	2012

Figure 4

## TURNOUT BY POLITICAL AFFILIATION

From the tables described above, we calculate turnout by voting precinct for 2016 using the PANDAS 'group by technology', and the November 2016 voter registration snapshot. We display turnout by party affiliation across the top and by precinct down the left side. Since precinct abbreviations are only unique within a single county, we also group by the county name. A sample of this data is in Figure 5 below:

Party		REP	DEM	UNA	LIB
Year		2016	2016	2016	2016
county_desc	precinct_abbrev				
BRUNSWICK	10B	91.3%	86.9%	89.3%	57.1%
MOORE	PHA2	90.9%	87.2%	86.8%	62.5%
WAKE	01-07A	90.9%	71.2%	55.6%	100.0%
	01-05	90.1%	87.3%	80.1%	50.0%
FORSYTH	068	89.7%	75.6%	65.8%	75.0%

Figure 5

We created three different reports covering the entire state of North Carolina. The report in Appendix A1 (page 6) sorts the precincts in descending order according to Republican turnout. The report in Appendix A2 (page 44) sorts the precincts in descending order according to Democratic turnout. The report in Appendix A3 (page 82) sorts the precincts in descending order according to Unaffiliated turnout. We removed Libertarian data since this is an extremely small population in North Carolina and do improve readability.

# Analysis of North Carolina Voter Turnout in the November 2016 General Election

## TURNOUT BY POLITICAL SENTIMENT

In the previous report, we described the creation of a model to predict 'sentiment' (Republican or Democrat) based upon available demographic information. We also described how to vary the logistic classifier threshold to equalize 'specificity' and 'sensitivity'. One of our objectives in this report is to examine the 'partisanship' of turnout by precinct in the 2016 general election. The way we did this was by creating a new field in the table that captures 'sentiment'. This field is set to actual party registration **if and only if this registration is Democrat or Republican**. If a voter is not registered in one of these two parties, we use the logistic classifier described in the previous report to classify sentiment as either 'Republican' or 'Democrat'. Since we are doing predictions for a population rather individual, we set the classifier 'threshold' to 0.56, which equalizes model 'specificity' and 'sensitivity'.

From the tables described above, we calculate turnout by voting precinct using the PANDAS 'group by' technology and the June 2017 voter registration data (that we originally used to create the logistic classifier). We display turnout by party sentiment (either Democrat or Republican) across the top and by precinct down the left side. Since precinct abbreviations are only unique within a single county, we also group by the county name. A sample of this data is in Figure 6 below:

		REP	DEM
county_desc	precinct_abbrev		
GASTON	3	90.9%	62.7%
ALAMANCE	03N2	89.7%	88.4%
HENDERSON	CV	87.9%	84.8%
ORANGE	WDS	87.2%	95.8%
MOORE	PHA2	87.0%	86.6%
BRUNSWICK	10B	86.4%	84.2%
WAKE	01-10	86.2%	90.5%
	01-05	86.1%	86.3%

Figure 6

We created two different reports covering the entire state of North Carolina. The report in Appendix B1 (page 120) sorts the precincts in descending order according to 'Republican Sentiment' turnout. The report in Appendix B2 (page 158) sorts the precincts in descending order according to 'Democratic Sentiment' turnout.

## CHANGE IN TURNOUT FOR 2016 COMPARED WITH TURNOUT FROM 2012 AND 2008

In order to compare 2016 turnout with 2012 and 2008 turnout, we will measure voter turnout as the quotient of the number of registered voters that voted in each of these three elections in question divided by the total number of voters **registered for each of the three specific elections**. This required us to calculate turnout for each year separately using the three specific voter registration snapshots for each of the three years. A subset of this data is displayed in Figure 4 from the 'Data Shaping and Joining' section of this report.

To compare turnout, we needed to save (as a PANDAS DataFrame) each of the three reports shown in figure 4 and then do an 'inner join' of all three reports. We needed to use 'inner join' since comparisons are only valid if the precincts are in all three registration datasets. This combined the '2008' column from the first DataFrame with the '2012' column from the second DataFrame and the '2016' column from the third DataFrame into a single DataFrame with all three voter turnout percentages. We then divided the 2016 percentage by the 2012 percentage to create a

# Analysis of North Carolina Voter Turnout in the November 2016 General Election

new column 'COMP 2012' that contained the relative percentage of the 2016 turnout compared to 2012. A number greater than 100% indicates an increase, and less than 100% a decrease. We also created another new column 'COMP 2008' that contained the relative percentage compared with 2008. . A sample of this data is in Figure 7 below:

Party Year		REP					DEM					UNA				
		COMP 2012	COMP 2008	2016	2012	2008	COMP 2012	COMP 2008	2016	2012	2008	COMP 2012	COMP 2008	2016	2012	2008
TYRRELL	1	214.3%	107.1%	71.4%	33.3%	66.7%	97.1%	88.7%	70.3%	72.4%	79.3%	112.5%	90.5%	66.7%	59.3%	73.7%

	405	153.5%	104.3%	43.3%	28.9%	41.6%	92.4%	92.7%	46.9%	51.1%	50.6%	91.7%	92.2%	43.3%	47.4%	47.0%
MECKLENBURG	120	153.1%	214.0%	59.0%	38.6%	27.6%	90.4%	98.2%	53.3%	59.0%	54.3%	110.6%	141.5%	46.0%	41.6%	32.5%
	016	148.1%	163.0%	66.7%	45.0%	40.9%	87.8%	88.3%	66.6%	75.8%	75.5%	93.4%	94.1%	54.1%	57.9%	57.5%
JACKSON	CUL	147.0%	126.4%	67.1%	45.6%	53.1%	120.1%	107.8%	70.7%	58.8%	65.6%	100.5%	98.5%	56.2%	51.8%	57.1%

**Figure 7**

For example, in Mecklenburg County's '054' precinct, Republican turnout increased by 60.6% from 2012 to 2016 while Democratic turnout decreased by 5.4% over the same period.

We created three different reports covering the entire state of North Carolina. The report in Appendix C1 (page 196) sorts the precincts in descending order according to Republican turnout increase between 2016 and 2012. The report in Appendix C2 (page 248) sorts the precincts in descending order according to Democratic turnout increase. The report in Appendix C3 (page 300) sorts the precincts in descending order according to Unaffiliated turnout increase.
